Drosophila melanogaster genome survey sequence SP6 end of BAC BACN13C23 of DrosBAC library from Drosophila melanogaster (fruit AL1950.2 AL105023.1 GI:5617037
                                                                                                                                                                                                                                                                                                                                                                                      Web: www.genoscope.cns.fr)
Determination of this BAC-end sequence was carried out as part of a collaboration with the Buropean Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.ut. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ξ,

Novel method for the enzymatic transfer of sugar molecules to an acceptor, useful for synthesis of e.g. polysaccharide bioadhesives or

```
The present sequence is the Pasteurella multocida chondroitan synthase pmCS. PmCS catalyses glycosaminoglycan polymerisation to produce chondroitan: a linear polyaeccharide which has viscoelastic properties which makes it useful for a number of applications. Chondroitan can be used with hyaluronic acid (HA) to coat medical devices e.g. catheters and sensors to reduce tissue abrasion. In addition, they can be used as bloadhesives for haemostatic scaling and healing of wounds and surgical incisions; and as blomaterials that provide sustained delivery of encapsulated drugs, to wounds, ulcers, injuries or surgical sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             KKLNNIIEYNKNIEVIILHVDKNHLTPDIKKEILAFYHKHQVNILLNNDISYYTSNRLIK 780

The present invention relates to the coding sequence of the Pasteurella multocida chondroitin synthase. A chondroitin polysaccharide may be used as a hyaluronan polysaccharide substitute in medial or cometic applications, for example in eye or joint applications, for moisturiser or wound dressings. The enzyme may be used in covalently coupling specific drugs, proteins or toxins to the structurally modified chondroitin for general or targeted drug delivery or radiological procedures, covalently cross linking the hyaluronic acid itself or to other supports to achieve a gel or other three diamensional biomaterial to a surface to create a biocompatible film or monolayer. The present sequence is one version of the protein of the invention.
                                                                                                                                                                                                                                                                                                                                                      Chondroitin synthase; dermatan sulphate; chondroitin sulphate polymer; eye application; joint application; moisturiser; drug delivery; wound dressing; biocompatible film.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New chondroitin synthase gene obtained from Pasteurella multocida, useful as hyaluronan polysaccharide substitute in medial or cosmetic applications, e.g. for eye or joint applications, for moisturizer or

The present invention relates to the coding sequence of the Pasteurella multocida chondroitin synthase. A chondroitin polysaccharide may be used as a hyaluronan polysaccharide substitute in medial or cosmetic applications, for example in eye or joint applications, for moisturiser or wound dressings. The enzyme may be used in covalently coupling specific drugs, proteins or toxins to the structurally modified chondroitin for general or targeted drug delivery or radiological procedures, covalently cross linking the hyaluronic acid itself or to other supports to achieve a gel or other three dimensional biomaterial with stronger physical properties, and covalently linking hyaluronic acid to a surface to create a biocompatible film or monolayer. The present sequence is one version of the protein of the invention.

This present sequence represents the hyaluronate synthase (pmHAS)

of Pasteurella multocida Carter Type A. The pmHAS enzyme has

different kinetic optima with respect to pH and metal ion

capendence, and different Km values compared with the HAS enzymes

of Streptococcus equisimilis (see AAY06206) and Streptococcus

cyogenes. Km values are about 2- to 3-fold lower for UDP sugars,

cyogenes. Km values are about 2- to 3-fold lower for UDP sugars,

cyogenes are about 2- to 3-fold invertion

cyogenes. Compaining hyaluronate synthase DNA,

cepecially S. equisimilis hyaluronate synthase DNA,

cepecially S. equisimilis hyaluronate synthase DNA,

cand prokaryotic or eukaryotic host cells which produce the enzyme

and its hyaluronic acid product, particularly a product with

modified structure or molecular size. The hyaluronic acid produced

this way is purer than that produced by conventional methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            594 TDGFNENIENAVDYDMFLKLSEVGKFKHLNKICYNRVLHGDNTSIKKLGIQKKNHFVVVN 653

This is the Pasturella multocida hyaluronate synthase (PmHAS) amino acid sequence. Hyaluronic acid (HA) or hyaluronan, is a polysaccharide that serves both structural and recognition roles in higher animals. Bacteria produce extracellular capsules of HA which mimic their host HA and aid escape from a host immune response. The invention includes a vector containing the PmHAS nucleotide sequence which can be used to express PmHAS in a foreign host. The HS nucleic acids can be used for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           vaccines

production of HA. Also, specific changes to the HS coding sequence can result in the production of HA having a modified size distribution or structural configuration and functional properties. The HA products can be used in e.g. drug delivery, angiogenesis and wound healing, stabilisation of recombinant proteins and in cosmetics. The HS nucleic pacific can also be used to develop agents to block capsule synthesis by pathogens and act as antibiotics. The avirulent P. multocida strains can be used as vaccines for fowl cholera or shipping fever.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the soluble recombinant form of Pasteurella multocida hyaluronic acid synthase-D, PuHAS-D. This sequence encompasses residues 1 to 703 of the 972 residues of the native PuHAS-D. This sequence encompasses catalyses glycosaminoglycan polymerisation to produce hyaluronic acid, catalyses glycosaminoglycan polymerisation to produce hyaluronic acid, that a linear polysaccharide. Ha has viscoelastic properties which makes that useful for a number of applications. HA can be used during ophthalmic surgery as a viscoelastic replacement for the vitroous humour e.g. during laplantation of intraocular lenses in cataract patients. HA injections directly into joints is also used to alleviate pain associated with a cathritis. HA can also be used to coat medical devices e.g. catheters and sensors to reduce tissue abrasion. HA can also be used as bloadhesives for haemostatic sealing and healing of wounds and surgical indislons; and so be used to produce sustained delivery of encapsulated drugs, to wounds, ulcers, injuries or surgical sites. The present sequence can therefore be used to produce HA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel method for the enzymatic transfer of sugar molecules to an acceptor, useful for synthesis of e.g. polysaccharide bioadhesives or drug delivery systems, including hybrid molecules

                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the genome sequence of Listeria

monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of

the are useful for selecting probes and primers for detecting genes in L.

monocytogenes and related organisms, and for studying genetic

polymorphisms and other genomes. The present sequence is a protein

encoded by the genome sequence of the present invention. Proteins

cypressed from the genome sequence are useful for raising specific

antibodies, identification of L. monocytogenes and related organisms, and

for blosynthesis and blodegradation, especially blosynthesis of Vitamin

ELS. The genome sequence and proteins encoded by it are also useful for

selecting compounds that regulate gene expression and cell replication

and modulate L. monocytogenes related diseases. In addition, the genome

sequence and proteins encoded by it are useful in pharmaceutical and

vaccines compositions for the treatment or prevention of infections by L.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          monocytogenes and related organisms.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are scherichia coli, Staphylococcus aucueus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The communiate, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen corrections on the used to screen compounds in rational drug discovery programmes uncleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

On the printed specification, but was obtained in electronic format directly from WIPO at the printed probablished_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     25;

The invention relates to antisense inhibitors of genes essential to prokaryotic callular proliferation, their use in identifying the genes, their use in the discovery of novel antiborities, the essential comes, their use in the discovery of novel antiborities, the essential comes, their use in the discovery of novel antiborities, the essential comes are themselves and the encoded proteins. The proteins coll, Staphylococcus aud Enterococcus facelis: The neumoniae, Pseudomonas acrudinosa and Enterococcus facelis: The cinvention is also useful for the identification of potential new targets for antibotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery corporammes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic callular proliferation protein.

Control of the printed specification, but was obtained in electronic form and directly from MIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus progenese (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detect Streptococcus in a biological sample. (I) are used to detect of encoding (I), may be used to detect of encoding (I), may be used to recombinantly produce (I) and may be used in gene therapy. Antiboddes to (I) are used for affinity chromogoraphy. Immunoassays, and distinguishing/identifying

P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial

```
This sequence represents the protein encoded by the epsI gene from the Streptococcus thermophilus exopolysaccharide (EPS) synthesis operon. The operon has 13 open reading frames (ORF) designated epsA-M encoding proteins AAW22169-81. This protein has 24% identity to a protein encoded by the RfbV ORF of the rfb cluster from Salmonella typhimurium and is probably a glycosyl transferase. The EPS are useful for thickening e.g. drinks, liquid desserts, yoghurts, soups, ice-creams, coffee creams, sauces, mayonnaise.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    722 KLNNIIEYNKN-IFV----IILHVDKNHLTPDIKKEILAFYHKHQVNILLNNDISYYTSN 776

                                                                                                                                                                                                                                               A chromosomal DNA sequence representing practically the whole eps (exopolysaccharide blosynthesis) operon from Streptococcus thermophilus strain Sife (deposited as CNCM 1-1590) was isolated. The sequence contained 14 open reading frames, one of which was located on the complementary strand. The present sequence is decoded from the epsH open reading frame. The EpsH protein is probably a glycosyl transferase.

Novel exopolysaccharides can be produced by transforming lactic acid bacteria which produce exopolysaccharides with DNA encoding at least one enzyme from the eps operon. The new exopolysaccharides are useful for thickening drinks, liquid desserts, yoghurts, soups, ice-creams, coffee creams, sauces, mayonnaise, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S.thermophilus exopolysaccharide synthesis operon epsI gene product.

AAYSAU,J-10. Tepresent enzymes involved in the Dissylthebile.

Exopolysaccharides (EPS). These enzymes are designated EPSI-EPSI. and are encoded by open reading frames epsi-epsil. The enzymes are isolated from Lactobacillus helveticus strain LHS9. The proteins are used in method for the synthesis of EPS, which includes at least one step of forming a bond (alpha or beta-isomer) between C-1 (carrying the of forming aldehyde function, of an activated D-galactose pyranose), and a phosphate on a lipophilic or proteinaceous primer. Stepwise synthesis of EPS occurs with, in each step, addition of a new sugar unit, through the hemit, present at the end of a chain of sugar residues bonded to the unit, present at the end of a chain of sugar residues bonded to the prophate-transferase; EPS2, EPS3 and EPS4 are alphating phosphate-transferase; EPS5 and EPS6 have homology with an beta-phosphate-transferase; EPS5 and EPS6 have homology with a beta-phosphate-transferase; EPS5 and EPS6 have homology with a beta-phosphate-glowing repetitive unit; EPS10 transfer of phosphoturanose is a glycosyltransferase; EPS9 calalyses the transfer of phosphoturanose is a glycosyltransferase; EPS9 exalyses the transfer of phosphoturanose of force the following repetitive unit; EPS10 transports the polysaccharides conto the EPS enzyme are used to improve properties of formed particularly fermented milk products such as yoghurt and cheese, e.g. their organoleptic properties and flavour stability.
AAY54075-85 represent enzymes involved in the biosynthesis of

Sequence 39, Application US/09816028A

Factor No. US20020043369A1

GENERAL INFORMATION:

APPLICANT: Glibert, Michel

APPLICANT: National Research Council of Canada

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of

TITLE OF INVENTION: Campylobacter Glycosyltransferases

CURRENT PRILING DATE: 2001-03-21

PRIOR APPLICATION NUMBER: US 60/118,213

PRIOR PELING DATE: 1999-02-01

PRIOR PELING DATE: 2000-01-31

NUMBER OF SEQ ID NOS: 49

Sequence 34, Application US/09816028A

Patent No. US200200423691

GENERAL INFORMATION:

APPLICANT: Gilbert, Michel

APPLICANT: Wakarchuk, Warren W.

APPLICANT: Wakarchuk, Warren W.

APPLICANT: Wakarchuk, Warren W.

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of TITLE OF INVENTION: Campylobacter Glycosyltransferases

CURRENT APPLICATION UNMER: US 60/118, 213

PRIOR FILING DATE: 1999-02-01

PRIOR FILING DATE: 2001-01-31

PRIOR FILING DATE: 2000-01-31

NUMBER OF SEQ ID NOS: 49

SOFTWARE: Patentin Ver: 2.1

SEQ ID NOS: 49
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     25;
